SAMPLE PROJECT REPORT

Streamlining IT Procurement

Automating Standard Laptop Orders with Flow Designer

Platform	ServiceNow Flow Designer
Team ID	SWTID-2026-2051
Team Size	4 members
Document Type	Sample documentation for GitHub

Prepared as a sample template. Replace the proposed workflow with the actual configuration and test results before submission.

1. Project Overview

This project proposes using ServiceNow Flow Designer to streamline standard laptop order requests. The goal is to reduce repetitive manual work, improve consistency, and make request processing easier to track.

2. Objectives

- Automate standard laptop order request handling.
- Reduce manual processing and avoid common data-entry errors.
- Apply consistent conditions and actions to eligible requests.
- Improve request status visibility and traceability.
- Document implementation and testing for future maintenance.

3. Proposed Workflow

Step	Activity	Description
1	Submit request	A user submits a standard laptop order request through the configured request interface.
2	Trigger flow	The flow starts when the configured trigger condition is met.
3	Validate details	Required request fields and eligibility conditions are checked.
4	Process request	Configured actions route or update the request according to project requirements.
5	Update status	The request is updated to reflect the current processing stage.
6	Test and verify	Test cases confirm the expected behavior and record any issues.

4. Technologies

ServiceNow platform, Flow Designer, Service Catalog (if used by the implementation), and GitHub for version-controlled documentation and project artifacts.

5. Suggested GitHub Repository Structure

- README.md - project summary, setup notes, workflow overview
- docs/ - design notes and implementation steps
- screenshots/ - screenshots of the actual configured flow and test results
- test-cases/ - test scenarios and observed outcomes
- exports/ - supported, sanitized project export files if permitted

6. Testing Checklist

Test	Expected result	Status
Valid standard laptop request	Flow starts and follows configured actions	To be tested

Test	Expected result	Status
Missing required field	Validation or configured error handling occurs	To be tested
Ineligible request	Configured condition prevents the standard path	To be tested
Status update	Request status reflects the configured process	To be tested

7. Expected Outcomes

The intended outcomes are more consistent request processing, less repetitive manual work, and clearer tracking. These outcomes should be confirmed with real tests rather than claimed as achieved before implementation.

8. Team Details

Role	Name
Team Leader	Megatharshini R
Team Member	Dhanalakshmi R
Team Member	Kathiravan R
Team Member	Dharani R

Important: This is a sample report, not proof of completed implementation. Update it with the actual flow design, screenshots, and test evidence before submitting.
